Newton's second law for rotational motion is: $\Sigma\tau = I\alpha$ (8.8) where $\Sigma\tau$ is the sum of all torques acting on the rigid body, α is the angular acceleration and I is the moment of inertia. Normally the mass is the easy part. With rotational motion, the 'mass' part is the moment of inertia.

Since the rotational inertia is a sum, you can always mentally decompose the object into several parts, find the rotational inertia of each part, and then add them. The rotational inertia depends on the location of the rotation axis. The same object will have a different rotational inertia depending on where it is rotating.
