Introduction. Magnetic fields are used to describe forces at a distance from electric currents. These currents are of two types: (1) free, or Amperian, currents as drawn from a battery pack, power supply, or an electrical outlet and (2) bound currents as in permanent magnet materials.

Levitation - Introduction - Coilgun

There are two main properties that allow the Levitron to levitate stably. The first is the magnetic repulsion, which provides the force for levitation. The second are gyroscopic effects due to the spinning of the top, which account for the stability of the levitation. The Levitron consists of a base and a top.
