Mass is a measure of the amount of matter that an object has, or how much "stuff" it is made up of. Weight is a measure of how much gravity pulls on a mass or object. On the moon, there is less gravity pulling on objects, so they weigh less.

Many students of physics confuse weight with mass. The mass of an object refers to the amount of matter that is contained by the object; the weight of an object is the force of gravity acting upon that object. Mass is related to how much stuff is there and weight is related to the pull of the Earth (or any other planet) upon that stuff. The mass of an object (measured in kg) will be the same no matter where in the universe that object is located.

Types of Forces - The Physics Classroom

Unbalanced forces cause objects to accelerate. But not all objects accelerate at the same rate when exposed to the same amount of unbalanced force. Inertia describes the relative amount of resistance to change that an object possesses. The greater the mass the object possesses, the more inertia that it has, and the greater its tendency to not accelerate as much.

Inertia and Mass - The Physics Classroom

As in space if no gravity acts upon an object, its weight becomes zero. Mass is a scalar quantity. It has magnitude. Weight is a vector quantity. It has magnitude and is directed toward the center of the Earth or other gravity well. Mass is commonly measured in kilograms and grams. Weight is commonly measured in Newtons.
