### Porifera Cnidaria And Ctenophora Eolss

Porifera (sponges) and Cnidaria (sea anemones, corals, and medusae) include numerous species, while few species of Ctenophores (jelly combs) have been described. The greater number of the species belonging to these groups is marine based, but a few families of Porifera and Cnidaria are found in fresh water.

### Porifera, Cnidaria, and Ctenophora

Basal metazoans comprise the four non-bilaterian animal phyla Porifera (sponges), Cnidaria (anthozoans and jellyfishes), Placozoa (Trichoplax) and Ctenophora (comb jellies).

Cnidaria vs Porifera . Only because Cnidaria and Porifera are phyla with small bodied organisms, it does not mean that they are closely related. Cnidarians and poriferans are mostly marine animals, but some are found in freshwater, as well. There are many differences exhibited between cnidarians and poriferans discussed in this article. Cnidaria and Ctenophora are two phyla containing coelenterates with a hollow gut. Both cnidarians and ctenophores are diploblastic animals. The internal body cavity serves as the gut. The gut is covered by a tissue called gastroderm. A single opening serves as both mouth and the anus in cnidarians.

The fundamental difference between Cnidaria and Ctenophora is that the cnidaria have distinguishing cnidocytes while the Ctenophora have distinguishing comb plate. Also, their habitat contributes to another difference between Cnidaria and Ctenophora. That is, Cnidarians live in both marine and freshwater while Ctenophora are totally marine organisms.

However, ctenophora was not included in the analyses, placing the placozoans outside of the sampled Eumetazoans. Cnidaria-sister hypothesis. DNA studies suggests that these organisms are related to Cnidaria, derived from planula larva (as seen in some Cnidaria). The Bilateria also are derived from planuloids.

### Placozoa - Wikipedia

Ctenophora is a phylum of marine organisms found in waters around the world. Their most distinctive feature is the combs, groups of cilia, which they use for swimming. They are the largest animals that swim by means of cilia. Adults of various species range from a few millimeters to 1.5 m in size. Like cnidarians, their bodies consist of a mass ...

It is difficult to reconstruct the early stages in the evolutionary "family tree" of animals using only morphology (their shapes and structures), because the large differences between Porifera (sponges), Cnidaria plus Ctenophora (comb jellies), Placozoa and Bilateria (all the more complex animals) make comparisons difficult.

This class has been lost in Placozoa and Cnidaria, as well as in Ctenophora (under the sponges-first hypothesis), and in some bilaterian clades, such as Platyhelminthes, Arthropoda, and Nematoda. The Eomes class gave rise to the paralog subclasses Tbx21, Eomes, and Tbrain in vertebrates.
